

Evaluation Loop Feedback

Making the evaluate → diagnose → improve → re-evaluate loop explicit in the End-to-End Agent Evaluation briefing

Summary

The current briefing undersells our evaluation loop. It presents a single linear path:

→ and jumps straight from that path to a release decision. It does not make the **evaluate → diagnose failures → improve → re-evaluate** loop explicit — which is arguably the most important part of “End-to-End Agent Evaluation.” I would combine the two rather than choose one.

Recommendation 1 — Add the Evaluation Loop Strip

Keep the existing briefing as page one, and add one additional strip beneath it:

Figure 1 — the evaluation loop strip

Then, beneath the strip, list what is scored:

- Investigation
- Grounding
- Authority
- Validation

- Final disposition
- Cost / latency / bounds

And retain the existing, and already clear, three-way disposition:

REPAIR	The defect is real — here is the bounded fix.
NO_REPAIR	The state is legitimate; no action.
ESCALATE	Outside the agent's authority to decide.

Recommendation 2 — Two Wording Changes

a) The “DENIED” framing

Current wording:

“a DENIED result counts as success”

This could be misread as gaming the evaluation. I would write instead:

“Tool calls are scored by correct governed behavior; a correctly denied unauthorized call is a valid outcome.”

More precise, less surprising.

b) The baseline arms

Current wording:

“Baseline arms: no model, and model-with-no-tools”

I would make the three arms explicit:

Always-escalate	No model; deterministic control
Alert-only	Same model, same prompt, zero tools
Full ADII	Same model with governed evidence tools

This is much stronger because the audience immediately sees which variable is being isolated at each step.

Recommendation 3 — Final Presentation Stack

I would use a three-page stack rather than a single page:

Page 1 — Team Briefing

“Here is the requirement. Here is exactly how ADII implements it.”

Page 2 — How ADII Works

Page 3 — End-to-End Evaluation

B0 → evaluate → failures → improve → P1 → freeze → unseen → release
